

### QUIZ – 20 minutes – open notes

1. Prove that the complement of a simple disconnected graph  $G$  must be connected
2. Let  $v$  be a cut vertex in  $G$ , prove or disprove:  $G' - v$  is connected, where  $G'$  indicates the complement of  $G$ .

Each question worth 5 marks.

Thursday, January 22, 2015

Q 1. Let  $G'$  denote the complement of  $G$ .

Consider  $u, v \in V(G)$ .

Case 1.  $u$  and  $v$  are in different components of  $G$ .

Then there is no  $uv$  edge in  $E(G)$ .  
Hence, there is a  $uv$  edge in  $E(G')$ ;  
and so there is a ~~path~~  $uv$ -path in  $G'$ .

Case 2.  $u$  and  $v$  are in the same component, say  $K_1$ , in  $G$ .

Now, since  $G$  is disconnected, it has a component  $K_2$  different from  $K_1$ .

Let  $x$  be a vertex in  $K_2$ .

Then, by case 1, we have edges

$ux$  and  $vx$  in  $G'$ .

Hence, there is a path  $uxv$  from  $u$  to  $v$  in  $G'$ .

Since there is a  $uv$ -path in  $G'$  for any vertices  $u, v$ ,  $G'$  is connected.

Q2,  $G' - v$  is connected.

- i.e. the statement is to be proved; here  $v$  is a cut vertex of  $G$ .

Proof: let  $K_1, K_2, \dots, K_m$ ,  $m \geq 2$ , be the components of  ~~$G - v$~~   $G - v$  and let  $x, y$  be any two vertices of  $G$ .

We need to show there is an  $xy$ -path in  $G' - v$ .

Case 1.  $x$  and  $y$  are in different components of  $G - v$ .

$\therefore$  there is no  $xy$ -edge in  $E(G)$ .

$\therefore$  the edge  $xy \in E(G')$

$\therefore$  the edge  $xy \in E(G' - v)$

Case 2. ~~See~~  $x$  and  $y$  belong to the same component of  $G - v$ , say  $K_i$ .

Then, there is at least one other component, say  $K_j$ .

let  $z \in K_j$ .

As shown in Case 1, the edges  $xz$  and  $yz \in E(G' - v)$ .

Hence, we get an ~~an~~ alternate path  $xzy$  between  $x$  and  $y$  in  $G' - v$ .

Q2. Alternate Method, we ~~show~~ <sup>claim</sup> that  $G' - v = (G - v)'$

Now, since  $G - v$  is a disconnected graph (since  $v$  is given to be a cut-vertex),  $(G - v)'$  is connected by Q1, and we are done.

Proof of Claim:-

~~we~~ Put  $H = G' - v$

and  $K = (G - v)'$

Then,  $V(H) = V(K) = V(G) - v$

It remains to show that  $E(H) = E(K)$ .

a) Suppose  $e \in E(H)$

$\therefore e \in E(G')$  and  $v$  is not incident with  $e$

$\therefore e \notin E(G)$  and  $v$  is not incident with  $e$

$\therefore e \notin E(G - v)$

$\therefore e \in E(G - v)' = E(K)$

b) Suppose  $e \in E(K)$

~~$e \notin E(G - v)$~~

$\therefore e$  is an edge ~~of the~~ on vertex set of  $G - v$ , i.e.

$v$  is not incident with  $e$ .

But  $e$  is not an edge of  $G - v$ ,

i.e.  $e \notin E(G)$  and  $v$  is

not incident with  $v$ ,

i.e.  $e \in E(G' - v)$

$\therefore E(H) = E(K)$
